# Objective

This document describes how to generate the coefficients for the two NTC polynomial equations for any thermistor using TI's GPC tool.

## Introduction

The NTC temperature measurement can be carried out either by using the Arrhenius equation (similar to FS-LT and ACPA) or by using the dedicated polynomial in the AFE. The problem with the first approach is that we are using an internal pull up resistor inside the AFE for biasing the NTCs. The value of the resistor in the datasheet is -

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$R_{(TS\_PU)}$	Internal pullup resistance <sup>(2)</sup>	Setting for nominal 18-kΩ	14.4	18.3	21.6	kΩ
		Setting for nominal 180-kΩ	140	178	216	kΩ

Even though the typical value of the resistor is 18.3kΩ, the minimum and maximum values are 14.4kΩ and 21.6kΩ respectively. This value of this resistor is measured and stored in the AFE by TI, but is inaccessible to the user. Using 18.3kΩ value resistor value in the Arrhenius equation to measure NTC resistance will lead to a large error in measurement. Hence this method is unsuitable. The polynomial method also uses the internal pullup resistor, the difference being it has access to the measured resistance value and hence more accurate measurement can be made. We will be using the polynomial method for temperature measurement.

The BQ76952 makes use of two polynomial equations to calculate temperature from the NTC resistance. Below are the two polynomials which can be configured in the AFE to obtain accurate Temperature readings.

AFE Polynomial 1

$$y1 = A1 * x^4 + A2 * x^3 + A3 * x^2 + A4 * x^1 + A5$$

AFE Polynomial 2

$$y2 = B1 * x^3 + B2 * x^2 + B3 * x^1 + B4$$

The coefficients A1, A2, A3, A4, A5, B1, B2, B3, B4 are to be calculated using a TI utility. The coefficient values are unique for each NTC, hence for every NTC, these have to be newly generated.

The coefficients are generated from a lookup table present in the NTC datasheet hence there is no need for NTC beta (  $\beta$  ) value or the NTC resistance. Below is an example of the NTC lookup table. If the NTC lookup table is not present in the datasheet, the coefficients cannot be calculated.

## Using TI's GPC tool

The GPC tool requires a single .zip file containing one configuration file, and one data file, as input. The name of the .zip file is not important. The .zip file must contain these files:

- config.txt
- thermistor.txt

## Configuration File

The configuration filz

**ProcessingType = 7** Determines the type of tool used. Value must be 7 for the Thermistor Coefficient Calculator

**Rpullup = 18k** or 180k depending on the pullup resistance needed for the thermistor

Example config.txt File:

```

config.txt — C:\Users\niran\Downloads\Thermistor Data\neg30_pos130 — Atom
File Edit View Selection Find Packages Help
config.txt
1 ProcessingType=7
2 Rpullup=18k

```

The above config.txt file can be found [here](#). Use this file as a template for all the other NTCs.

# Thermistor.txt File

The thermistors.txt file lists the resistances (in Ohms) and temperatures (in degrees C) from the thermistor datasheet. Do not alter from the example provided.

Example thermistors.txt file:

config.txt	thermistor.txt
1	# Resistances (Ohms)
2	117555
3	111446
4	105695
5	100279

193 -2
```

The above thermistor.txt file can be found [here](#). Use this file as a template for all the other NTCs.

After you have created the thermistor.txt and config.txt, put both of them in the same directory and create a zip folder. The zip folder from the above example can be downloaded from [here](#).

Here is the link to the [GPC tool](#). To use this tool you have to create your account on ti.com using your maxwell email ID.

Upload the zip folder to the GPC tool.

## Gauging Parameter Calculator (GPC) Tool - Upload

Gauging parameter calculator supports the bq series of battery fuel gauges.

Upload your completed input zip file below by clicking "Browse" and by selecting your file. The zip file must be uploaded in the format specified in the instruction manual and you must click "I Agree" to the Terms and Conditions of Use below to proceed.

Upon successful upload, a gauging parameter report will be emailed to your my.ti.com account address within approximately one hour.

### Upload Zip File

Zip file format as specified in instruction manual is required.

[Browse](#)

### Terms & Conditions of Use - Important Confidentiality

Acknowledgement and Agreement  
Gauging Parameter Calculator

IMPORTANT - PLEASE READ THE FOLLOWING AGREEMENT CAREFULLY. THIS IS A LEGALLY BINDING AGREEMENT. AFTER YOU READ THIS AGREEMENT, YOU WILL BE ASKED WHETHER YOU WISH TO SUBMIT YOUR DATA (AS DEFINED BELOW) TO TI. DO NOT CLICK "SUBMIT" UNLESS: (1) YOU ARE AUTHORIZED TO ACCEPT AND AGREE TO THE TERMS OF THIS AGREEMENT ON BEHALF OF

[Save Terms & Conditions](#)

☐ I Agree

[Submit](#)

After the file has been submitted successfully you should see the below message.

[Products](#) [Applications](#) [Design resources](#) [Quality & reliability](#) [Support & training](#) [About TI](#) 

## Gauging Parameter Calculator (GPC) Tool - Upload

### Submitted successfully!

Thank you for submitting your input data zip file. A gauging parameter report will be emailed to your my.ti.com account address within approximately one hour.

Note: Your report will be sent from gpc\_do\_not\_reply@ti.com. Please ensure that this address is not blocked by any email filters.

The usual wait time is ~15 mins after which you should receive an email on registered email with attachment. Download and unzip the attachment. The folder will contain a file named GPC\_report.txt. This file contains the coefficients for both the equations.

```

File Edit View Selection Find Packages Help
config.txt thermistor.txt GPC_report.txt
1
2 *****
3 Search complete, bestmaxerr = 0.3000000000000001137
4 bestA [A1 A2 A3 A4 A5] = [-16652 31696 -27396 26324 1344]
5 bestB [B1 B2 B3 B4] = [-1823 3456 -4014 4706]

```

The generated coefficients are configurable and can be updated in the BMS configuration as below -

Config ID	Coefficient	Value
320	A1	-16652
321	A2	31696
322	A3	-27396
323	A4	26324
324	A5	1344
325	B1	-1823
326	B2	3456
327	B3	-4014
328	B4	4706

## Error Compensation

The polynomial method has been tested [here](#) by emulating the NTC behavior with use of potentiometer. It has been observed that, at lower temperatures (typically below -5°C) there is a linear increase in the NTC error. It has been found that with further decrease in temperature the measurement error lies outside the specified range of  $\pm 2^\circ\text{C}$ . This error has to be compensated.

The compensation shall be done with the help of BMS configuration. In the configuration, we will be specifying the temperature value after which we apply the error correction factor. The second configuration parameter will be the slope of the observed error equation.

Observation Table -

Temp measured with AFE polynomial	Measured Resistance(kOhm)	Measured Resistance(Ohm)	Actual Temperature	Error in measurement in DegC	Thermistor
-17.4	88.11	88110	-20.61	-3.21	BGUASS
